

# Web user documentation

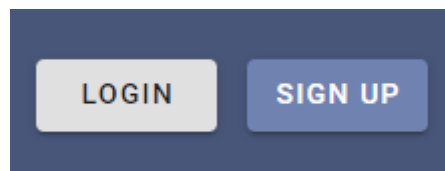

## Project description

The goal of this website is to provide users with an interface which purpose is to manage what we call Areas, for Action – Reaction. These Areas give you the ability to interact between different services' API.

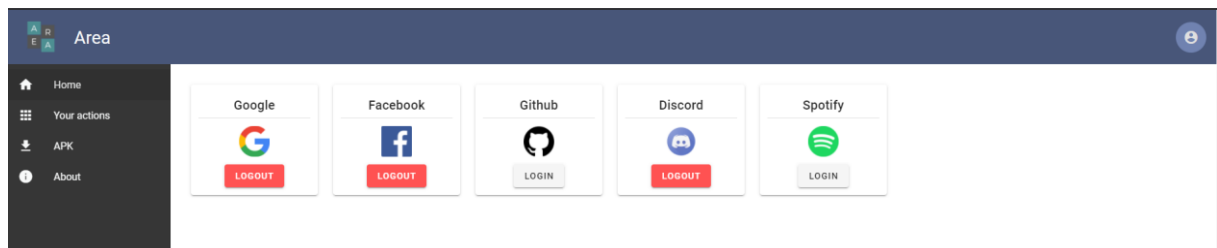

A setted up action with its parameters will generates a reaction on the selected API. An Area example would be: A discord bot notifying you when you or someone adds a track to one of your Spotify playlist.

## Website useflow

On your first arrival on the website, you must register using the button present in the site's header otherwise if you're not a new user, please use the login button.

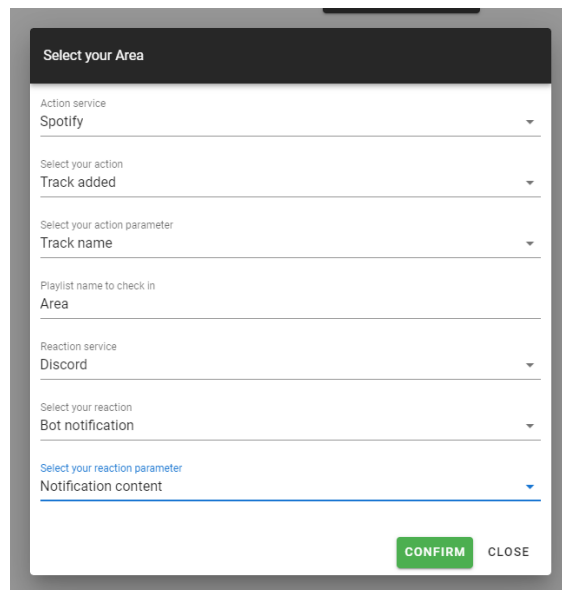

When you are logged in, you will be able to login to the different services in the home page. By doing so it will allow us to use the different informations we need so your Areas works. You can logout from any service at any time you want.

It is pretty easy to setup a new Area, just go to the “Your actions” page and then click the “Add new Action” button.

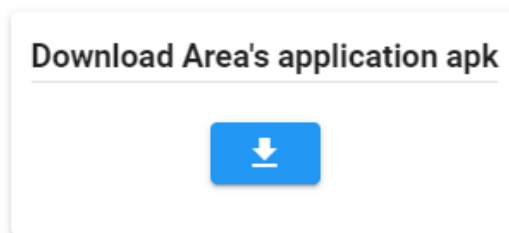

You can use our interface to setup the Area you want, then press the “Confirm” button.

The screenshot shows a configuration window titled "Select your Area". It contains several dropdown menus for setting up an automation: "Action service" is set to "Spotify", "Select your action" is "Track added", "Select your action parameter" is "Track name", "Playlist name to check in" is "Area", "Reaction service" is "Discord", "Select your reaction" is "Bot notification", and "Select your reaction parameter" is "Notification content". At the bottom right, there are two buttons: a green "CONFIRM" button and a grey "CLOSE" button.

If you want to use our service on your mobile device, you can do so by downloading the application APK in the “APK” page.

You can logout at any time from our website by clicking the “Logout” button present in the header.
